Keys for Growth - OPC, SCADAs and Networks

Keys for Growth- OPC, SCADAs and Networks as Key Tools in System Design Three elements enable the creation of compatible, robust architecture systems: OPC - (Openness, Productivity, and Connectivity) . SCADAs (Supervisory Control And Data Acquisition). These systems can then help provide process control optimization, but performance optimization, historical data analysis, maintenance and asset management among many other benefits. With a choice of the best packages for a given application designers can develop a system that is optimized for each specific goal. And the SCADA and even the HMI (Human Machine Interface) can be liberated from the process hardware to become the visual link for accessing distributed databases through a common Web browser.
